

Technical information about 'Safe Stamper Notify'

Sending of notifications with certified
delivery

APRIL, 2017

1-. Description:

Safe Stamper Notify enables the user to certify that a message has been received and opened by the recipient / s, how many times, at which exact moments, from which IP addresses, and whether the attached file has been downloaded.

2. How it works:

The user must enter the Safe Stamper Notify form on the official website. The following information is required on the form: the e-mail addresses of the recipients, their names, the subject of the message, the full text of the message, and an attached file if needed.

Safe Stamper sends the recipients a notification, letting them know that they have a pending message to read at a specific web address. In the notification, the visible information includes who is sending it and the subject of the message, but not the full message or the attached file.

Each time they access the link to read the full message, Safe Stamper obtains the information it needs to certify the opening of the email and all the other details.

The user who has sent the notification can check on Safe Stamper how many times they have accessed the message, from what IP addresses, the exact times when it happened, and whether the attached file was downloaded. Users can issue new certificates anytime they need, in order to include all the updated information. The certificate also includes the exact date and hour when the notification was sent.
