

Operating methods and technical description of Safe Stamper mail

Email certificacion

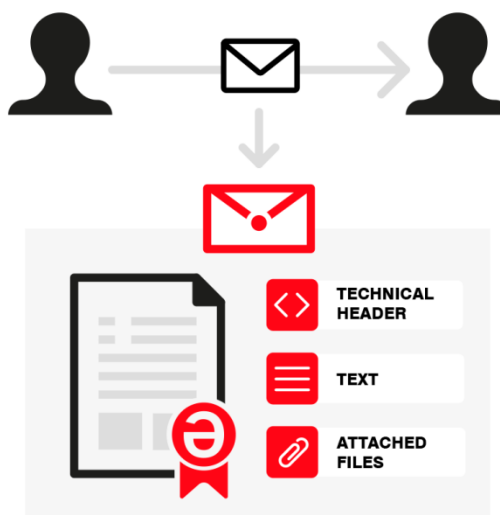

January 2016

1.- Operating methods

The sender who wishes to certify the sending of an email has to include as one of its recipients the address `certify@safestamper.com`.

This way the email is sent simultaneously to all senders, including Safe Stamper's email certification service.

Through this process Safe Stamper becomes witness of the specific date and hour when the email was received, the email addresses of sender and recipients, the text contained in the email, its header and the technical information it contains, as well as any attached files.

2.-Technology of the certification file

As knowing witness of the email's content, Safe Stamper's certification service saves the following information as a PDF file:

- In a legible format for PDF readers: the text on the email.
- Attached to the PDF file: The full content of the email body, including headers with technical information and all files attached to the email.

This certification file contains the date and hour the email was sent, the email addresses of sender and recipients, and of the full content of the email.

It serves as rigorous and reliable evidence to confirm the information it contains since it includes the recognized e-signature of the organization behind Safe Stamper: Safe Creative SL.
